| 1.1 Learning Outcomes.....                                                      | 4         |
| 1.2 Knowledge and Ability Map.....                                              | 4         |
| 1.3 End-to-End Reference Architecture.....                                      | 4         |
| <b>2. Evaluating Agentic AI Tools for Product Research and Development.....</b> | <b>6</b>  |
| 2.1 Agentic AI versus assistants.....                                           | 6         |
| 2.2 Product lifecycle application map.....                                      | 7         |
| 2.3 Opportunity framing.....                                                    | 8         |
| 2.4 Jobs-to-be-done lens.....                                                   | 9         |
| 2.5 Research-agent pattern.....                                                 | 10        |
| 2.6 Competitor intelligence workflow.....                                       | 11        |
| 2.7 Voice-of-customer synthesis.....                                            | 12        |
| 2.8 Persona and assumption map.....                                             | 13        |
| 2.9 Agentic builder landscape.....                                              | 14        |
| 2.10 Workflow versus autonomous agent.....                                      | 15        |
| 2.11 Build-buy-partner decision.....                                            | 16        |
| 2.12 Resource and skills readiness.....                                         | 17        |
| 2.13 Evaluation decision matrix.....                                            | 18        |
| <b>3. Building and Optimising Agentic Product Development Workflows.....</b>    | <b>19</b> |
| 3.1 Goal-plan-act-observe loop.....                                             | 19        |
| 3.2 Product context packet.....                                                 | 20        |
| 3.3 Outcome-focused specification.....                                          | 21        |
| 3.4 User stories and acceptance criteria.....                                   | 22        |
| 3.5 Journey-map orchestration.....                                              | 23        |
| 3.6 Single-agent baseline.....                                                  | 24        |

|                                                                              |           |
|------------------------------------------------------------------------------|-----------|
| 3.7 Multi-agent role design.....                                             | 25        |
| 3.8 Handoff contract.....                                                    | 26        |
| 3.9 Tool and retrieval grounding.....                                        | 27        |
| 3.10 Prompt contract design.....                                             | 28        |
| 3.11 Evaluation-set engineering.....                                         | 29        |
| 3.12 Iteration and error taxonomy.....                                       | 30        |
| 3.13 Prototype-to-learning loop.....                                         | 31        |
| <b>4. Deploying and Evaluating Agentic AI-Powered Product Solutions.....</b> | <b>32</b> |
| 4.1 Prototype-to-production gate.....                                        | 32        |
| 4.2 Deployment channel fit.....                                              | 33        |
| 4.3 Reference deployment architecture.....                                   | 34        |
| 4.4 API and integration contract.....                                        | 35        |
| 4.5 Programming skill mix.....                                               | 36        |
| 4.6 Security and privacy boundary.....                                       | 37        |
| 4.7 Human oversight design.....                                              | 38        |
| 4.8 Observability and product KPIs.....                                      | 39        |
| 4.9 Quality, latency and cost frontier.....                                  | 40        |
| 4.10 Production evaluation loop.....                                         | 41        |
| 4.11 Rollout and change management.....                                      | 42        |
| 4.12 Feedback and graceful failure.....                                      | 43        |
| 4.13 Benefit-trade-off recommendation.....                                   | 44        |
| <b>5. Hands-on Activity Guide.....</b>                                       | <b>45</b> |
| 5.1 Activity 01: Frame a Product Opportunity.....                            | 45        |
| 5.2 Activity 02: Compare Agentic AI Builders.....                            | 47        |
| 5.3 Activity 03: Build a Research Evidence Pack.....                         | 49        |
| 5.4 Activity 04: Create Persona and JTBD Map.....                            | 51        |
| 5.5 Activity 05: Design an Agent Workflow Canvas.....                        | 53        |
| 5.6 Activity 06: Create an AI-Ready PRD.....                                 | 55        |
| 5.7 Activity 07: Engineer a Prompt and Evaluation Set.....                   | 57        |
| 5.8 Activity 08: Run a Prototype Experiment.....                             | 59        |
| 5.9 Activity 09: Select a Deployment Posture.....                            | 61        |
| 5.10 Activity 10: Conduct a Risk and Control Review.....                     | 63        |
| 5.11 Activity 11: Design KPI and Feedback Dashboard.....                     | 65        |
| 5.12 Activity 12: Deliver a Governed Product Recommendation.....             | 67        |
| <b>6. Agentic Product Control and Evidence Contract.....</b>                 | <b>69</b> |
| <b>7. Assessment Preparation.....</b>                                        | <b>69</b> |
| <b>8. References.....</b>                                                    | <b>69</b> |

# 1. Course Overview

This Learner Guide supports an end-to-end, evidence-led agentic AI product-development workflow. Learners frame a validated opportunity, compare agentic builders, define roles and handoff contracts, build and test a thin prototype, then evaluate product value, quality, reliability, cost, risk and human accountability. The detailed procedures are intentionally kept here and out of the visual slide deck.

## SAFETY BOUNDARY

All lab data are synthetic. Work only in the supplied lab or a temporary copy. Never place live keys, personal data or proprietary secrets in prompts, files, logs or screenshots; keep destructive and external actions out of scope.

## 1.1 Learning Outcomes

- LO1 Evaluate agentic AI builders for product research and development, comparing strengths, limitations, resources and skills.
- LO2 Apply optimisation techniques to improve the efficiency, quality and control of agentic product-development workflows.
- LO3 Evaluate the benefits and trade-offs of deploying agentic AI-powered product solutions and recommend a governed path forward.

## 1.2 Knowledge and Ability Map

| Code | Competency statement                                                                                      | Primary evidence                                   |
|------|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| K1   | Range of applications of automation technologies across the product-development lifecycle.                | Written response                                   |
| K2   | Methods of evaluating the resources and skills required to carry out tasks using automation technologies. | Written response                                   |
| K3   | Concepts pertaining to performance specifications and analysis.                                           | Written response                                   |
| K4   | Best practices in automation.                                                                             | Written response                                   |
| K5   | Principles of applying automation technologies in products.                                               | Written response                                   |
| K6   | Types of programming skills used with automation technologies.                                            | Written response                                   |
| A1   | Evaluate automation technologies and compare their strengths and limitations.                             | product artifact, evaluation and decision evidence |
| A2   | Apply optimisation techniques to improve automated-process efficiency and product quality.                | product artifact, evaluation and decision evidence |
| A3   | Evaluate benefits and trade-offs of implementing automation in products and businesses.                   | product artifact, evaluation and decision evidence |

## 1.3 End-to-End Reference Architecture

1. Frame the product opportunity from observable user friction, a measurable baseline and a decision-linked target.
2. Compare agentic builders on a common task using fixed criteria, evidence, readiness and total-cost assumptions.

3. Create a versioned product context packet, outcome specification and explicit non-goals before orchestration.
4. Choose the simplest workflow or agent pattern that fits task variability, risk and required judgment.
5. Define agent roles, tool boundaries, handoff schemas, stop conditions and meaningful human approval gates.
6. Run a frozen evaluation set, classify failures and change one causal layer per optimisation cycle.
7. Combine business value, experience, quality, cost and risk evidence into a PILOT, EXPAND, HOLD or STOP recommendation.

## 2. Evaluating Agentic AI Tools for Product Research and Development

Identify a product opportunity, map it to a suitable agentic pattern, and compare builders using evidence, readiness and total-cost criteria.

### TOPIC OPERATING PRINCIPLE

Every agent handoff uses named fields; every consequential transition has a deterministic gate; every release decision resolves to evidence.

### 2.1 Agentic AI versus assistants

#### Mechanism

1. Receive goal
2. Plan work
3. Use tools
4. Adapt from results

| goal                                  | plan                               | tool_call                          | observation                                 |
|---------------------------------------|------------------------------------|------------------------------------|---------------------------------------------|
| Required state field for receive goal | Required state field for plan work | Required state field for use tools | Required state field for adapt from results |

#### Evidence and control

##### MEASURE

Goal completion rate with valid evidence

**Failure mode:** A chatbot response is mistaken for autonomous task completion.

**Control:** Require a multi-step loop, tool boundary and stop condition before calling a system agentic.

**Acceptance evidence:** Trace showing plan, tool result and final decision

## 2.2 Product lifecycle application map

### Mechanism

1. Discover need
2. Define concept
3. Deliver prototype
4. Learn in market

| insight                                | hypothesis                              | artifact                                   | feedback                                 |
|----------------------------------------|-----------------------------------------|--------------------------------------------|------------------------------------------|
| Required state field for discover need | Required state field for define concept | Required state field for deliver prototype | Required state field for learn in market |

### Evidence and control

#### MEASURE

% lifecycle stages with a named human owner

**Failure mode:** Automation is applied everywhere without a clear decision or owner.

**Control:** Map each agent task to one lifecycle decision and accountable role.

**Acceptance evidence:** Lifecycle map with task-owner pairs

## 2.3 Opportunity framing

### Mechanism

1. Observe friction
2. Name user
3. Quantify impact
4. Frame outcome

| problem                                   | user                               | baseline                                 | target                                 |
|-------------------------------------------|------------------------------------|------------------------------------------|----------------------------------------|
| Required state field for observe friction | Required state field for name user | Required state field for quantify impact | Required state field for frame outcome |

### Evidence and control

#### MEASURE

Validated problem statements / total ideas

**Failure mode:** The team automates an interesting task that is not a material user problem.

**Control:** Start with observable friction and a measurable outcome, not a tool demonstration.

**Acceptance evidence:** Opportunity brief with baseline and target

## 2.4 Jobs-to-be-done lens

### Mechanism

1. Capture situation
2. Identify progress
3. Expose obstacle
4. Define success

| situation                                  | job                                        | barrier                                  | outcome                                 |
|--------------------------------------------|--------------------------------------------|------------------------------------------|-----------------------------------------|
| Required state field for capture situation | Required state field for identify progress | Required state field for expose obstacle | Required state field for define success |

### Evidence and control

#### MEASURE

% research observations linked to a user job

**Failure mode:** Personas become demographics without decision-relevant needs.

**Control:** Write needs as progress users seek in a real context.

**Acceptance evidence:** JTBD statement linked to verbatim research notes

## 2.5 Research-agent pattern

### Mechanism

1. Set question
2. Gather sources
3. Triangulate claims
4. Synthesize insight

| question                              | source                                  | claim                                       | confidence                                  |
|---------------------------------------|-----------------------------------------|---------------------------------------------|---------------------------------------------|
| Required state field for set question | Required state field for gather sources | Required state field for triangulate claims | Required state field for synthesize insight |

### Evidence and control

#### MEASURE

% material claims supported by two independent sources

**Failure mode:** The agent produces polished synthesis from weak or circular evidence.

**Control:** Require source provenance, claim-level support and uncertainty labels.

**Acceptance evidence:** Research ledger and cited insight brief

## 2.6 Competitor intelligence workflow

### Mechanism

1. Choose peers
2. Freeze criteria
3. Collect evidence
4. Compare gaps

| peer                                  | criterion                                | evidence                                  | gap                                   |
|---------------------------------------|------------------------------------------|-------------------------------------------|---------------------------------------|
| Required state field for choose peers | Required state field for freeze criteria | Required state field for collect evidence | Required state field for compare gaps |

### Evidence and control

#### MEASURE

Comparable criteria populated per competitor

**Failure mode:** Different evidence standards make the comparison misleading.

**Control:** Freeze the same criteria and observation date before collection.

**Acceptance evidence:** Timestamped comparison matrix

## 2.7 Voice-of-customer synthesis

### Mechanism

1. Ingest feedback
2. Cluster themes
3. Test outliers
4. Prioritise need

| feedback_id                              | theme                                   | outlier                                | priority                                 |
|------------------------------------------|-----------------------------------------|----------------------------------------|------------------------------------------|
| Required state field for ingest feedback | Required state field for cluster themes | Required state field for test outliers | Required state field for prioritise need |

### Evidence and control

#### MEASURE

% themes traceable to source rows

**Failure mode:** A dominant-sounding summary hides minority but critical needs.

**Control:** Retain row-level traceability and inspect negative cases separately.

**Acceptance evidence:** Theme table with supporting and contradicting excerpts

## 2.8 Persona and assumption map

### Mechanism

1. Group evidence
2. Draft persona
3. Label assumptions
4. Plan validation

| segment                                 | need                                   | assumption                                 | test                                     |
|-----------------------------------------|----------------------------------------|--------------------------------------------|------------------------------------------|
| Required state field for group evidence | Required state field for draft persona | Required state field for label assumptions | Required state field for plan validation |

### Evidence and control

#### MEASURE

High-risk assumptions with a validation test

**Failure mode:** Generated personas are treated as facts about real users.

**Control:** Mark inferred attributes and separate evidence from hypothesis.

**Acceptance evidence:** Persona card plus assumption register

## 2.9 Agentic builder landscape

### Mechanism

1. Define use case
2. Shortlist builders
3. Run common task
4. Score fit

| use_case                                 | builder                                     | test_case                                | score                              |
|------------------------------------------|---------------------------------------------|------------------------------------------|------------------------------------|
| Required state field for define use case | Required state field for shortlist builders | Required state field for run common task | Required state field for score fit |

### Evidence and control

#### MEASURE

Weighted score on a common golden task

**Failure mode:** Feature lists replace direct comparison on the intended task.

**Control:** Run the same input, output and constraints across every candidate.

**Acceptance evidence:** Paired trial results and recommendation

## 2.10 Workflow versus autonomous agent

### Mechanism

1. Assess variability
2. Assess risk
3. Choose pattern
4. Set override

| variability                                 | risk                                 | pattern                                 | override                              |
|---------------------------------------------|--------------------------------------|-----------------------------------------|---------------------------------------|
| Required state field for assess variability | Required state field for assess risk | Required state field for choose pattern | Required state field for set override |

### Evidence and control

#### MEASURE

% high-risk steps on deterministic paths

**Failure mode:** Autonomy is added where a predictable workflow would be safer and cheaper.

**Control:** Use the simplest architecture that satisfies variability and judgment needs.

**Acceptance evidence:** Pattern decision with rejected alternatives

## 2.11 Build-buy-partner decision

### Mechanism

1. Clarify advantage
2. Estimate capability
3. Model ownership
4. Select posture

| advantage                                  | capability                                   | ownership_cost                           | posture                                 |
|--------------------------------------------|----------------------------------------------|------------------------------------------|-----------------------------------------|
| Required state field for clarify advantage | Required state field for estimate capability | Required state field for model ownership | Required state field for select posture |

### Evidence and control

#### MEASURE

Risk-adjusted value over total cost of ownership

**Failure mode:** Subscription price is compared with in-house build cost while integration and governance are ignored.

**Control:** Include change, integration, assurance and exit costs.

**Acceptance evidence:** Three-option decision table with sensitivity range

## 2.12 Resource and skills readiness

### Mechanism

1. List capabilities
2. Assess gaps
3. Plan controls
4. Sequence pilot

| data                                       | people                               | platform                               | governance                              |
|--------------------------------------------|--------------------------------------|----------------------------------------|-----------------------------------------|
| Required state field for list capabilities | Required state field for assess gaps | Required state field for plan controls | Required state field for sequence pilot |

### Evidence and control

#### MEASURE

Critical readiness gaps closed before pilot

**Failure mode:** A tool is selected before data access, ownership and evaluation skills exist.

**Control:** Gate pilot entry on minimum data, product, technical and risk capabilities.

**Acceptance evidence:** Readiness heatmap and action owners

## 2.13 Evaluation decision matrix

### Mechanism

1. Weight criteria
2. Score evidence
3. Test sensitivity
4. Recommend

| weight                                   | score                                   | sensitivity                               | decision                           |
|------------------------------------------|-----------------------------------------|-------------------------------------------|------------------------------------|
| Required state field for weight criteria | Required state field for score evidence | Required state field for test sensitivity | Required state field for recommend |

### Evidence and control

#### MEASURE

Recommendation stability across plausible weights

**Failure mode:** A predetermined winner is justified with arbitrary weights.

**Control:** Agree criteria before testing and show how weight changes affect the result.

**Acceptance evidence:** Weighted matrix, caveats and decision owner

## 3. Building and Optimising Agentic Product Development Workflows

Translate product intent into bounded agent roles, specifications, hand-offs, evaluation sets and an iterative prototype workflow that improves with evidence.

### TOPIC OPERATING PRINCIPLE

Every agent handoff uses named fields; every consequential transition has a deterministic gate; every release decision resolves to evidence.

### 3.1 Goal-plan-act-observe loop

#### Mechanism

1. Interpret goal
2. Choose next step
3. Act through tool
4. Observe state

| goal                                    | next_action                               | tool_result                               | status                                 |
|-----------------------------------------|-------------------------------------------|-------------------------------------------|----------------------------------------|
| Required state field for interpret goal | Required state field for choose next step | Required state field for act through tool | Required state field for observe state |

#### Evidence and control

##### MEASURE

% loops ending in a verified stop state

**Failure mode:** The agent loops without progress or stops on a plausible narrative.

**Control:** Use explicit budgets, stop conditions and observable state transitions.

**Acceptance evidence:** Loop trace with terminal status

## 3.2 Product context packet

### Mechanism

1. State vision
2. Name users
3. Add constraints
4. Define evidence

| vision                                | users                               | constraints                              | acceptance                               |
|---------------------------------------|-------------------------------------|------------------------------------------|------------------------------------------|
| Required state field for state vision | Required state field for name users | Required state field for add constraints | Required state field for define evidence |

### Evidence and control

#### MEASURE

Required context fields present before execution

**Failure mode:** The agent fills missing business context with generic assumptions.

**Control:** Version a compact context packet and expose unknowns explicitly.

**Acceptance evidence:** Context file and assumption log

### 3.3 Outcome-focused specification

#### Mechanism

1. Describe problem
2. Define behavior
3. Set boundaries
4. Specify done

| problem                                   | behavior                                 | non_goals                               | acceptance                            |
|-------------------------------------------|------------------------------------------|-----------------------------------------|---------------------------------------|
| Required state field for describe problem | Required state field for define behavior | Required state field for set boundaries | Required state field for specify done |

#### Evidence and control

##### MEASURE

% acceptance criteria observable by reviewer

**Failure mode:** The specification dictates implementation while leaving success ambiguous.

**Control:** Describe what must be true and what must not change.

**Acceptance evidence:** PRD section with testable criteria

## 3.4 User stories and acceptance criteria

### Mechanism

1. Name actor
2. State intent
3. Explain value
4. Write examples

| actor                               | intent                                | value                                  | examples                                |
|-------------------------------------|---------------------------------------|----------------------------------------|-----------------------------------------|
| Required state field for name actor | Required state field for state intent | Required state field for explain value | Required state field for write examples |

### Evidence and control

#### MEASURE

% stories with positive, edge and failure examples

**Failure mode:** A story is marked complete when only the happy path works.

**Control:** Attach concrete examples and negative conditions to each story.

**Acceptance evidence:** Story map with example-based acceptance

## 3.5 Journey-map orchestration

### Mechanism

1. Map stages
2. Locate friction
3. Assign agent role
4. Keep human gate

| stage                               | friction                                 | agent_role                                 | gate                                     |
|-------------------------------------|------------------------------------------|--------------------------------------------|------------------------------------------|
| Required state field for map stages | Required state field for locate friction | Required state field for assign agent role | Required state field for keep human gate |

### Evidence and control

#### MEASURE

% high-consequence moments with human control

**Failure mode:** The workflow optimises speed while weakening trust at critical moments.

**Control:** Preserve recovery, explanation and control at consequential journey points.

**Acceptance evidence:** Journey map with agent and human swimlanes

## 3.6 Single-agent baseline

### Mechanism

1. Bound one goal
2. Connect minimal tools
3. Run baseline
4. Measure gaps

| goal                                    | tools                                          | baseline                              | gaps                                  |
|-----------------------------------------|------------------------------------------------|---------------------------------------|---------------------------------------|
| Required state field for bound one goal | Required state field for connect minimal tools | Required state field for run baseline | Required state field for measure gaps |

### Evidence and control

#### MEASURE

Accepted tasks per 20-case evaluation set

**Failure mode:** A multi-agent design is introduced before a simpler baseline is measured.

**Control:** Prove the minimum viable agent before adding roles.

**Acceptance evidence:** Baseline run log and failure summary

## 3.7 Multi-agent role design

### Mechanism

1. Decompose domains
2. Assign role
3. Limit authority
4. Define coordinator

| domain                                     | role                                 | authority                                | coordinator                                 |
|--------------------------------------------|--------------------------------------|------------------------------------------|---------------------------------------------|
| Required state field for decompose domains | Required state field for assign role | Required state field for limit authority | Required state field for define coordinator |

### Evidence and control

#### MEASURE

Handoffs that add unique value / total handoffs

**Failure mode:** Multiple agents duplicate work and amplify inconsistent assumptions.

**Control:** Give each role distinct inputs, output schema and decision rights.

**Acceptance evidence:** Role charter and responsibility matrix

## 3.8 Handoff contract

### Mechanism

1. Validate input
2. Perform task
3. Emit schema
4. Acknowledge receipt

| input_schema                            | task                                  | output_schema                        | ack                                          |
|-----------------------------------------|---------------------------------------|--------------------------------------|----------------------------------------------|
| Required state field for validate input | Required state field for perform task | Required state field for emit schema | Required state field for acknowledge receipt |

### Evidence and control

#### MEASURE

% handoffs passing schema validation

**Failure mode:** Free-form outputs break downstream steps or lose provenance.

**Control:** Use stable identifiers, structured outputs and fail-closed validation.

**Acceptance evidence:** Handoff record with validation status

## 3.9 Tool and retrieval grounding

### Mechanism

1. Identify need
2. Select source
3. Retrieve context
4. Cite evidence

| need                                   | source                                 | context                                   | citation                               |
|----------------------------------------|----------------------------------------|-------------------------------------------|----------------------------------------|
| Required state field for identify need | Required state field for select source | Required state field for retrieve context | Required state field for cite evidence |

### Evidence and control

#### MEASURE

% answer claims grounded in approved sources

**Failure mode:** The agent uses stale, irrelevant or untrusted material as product truth.

**Control:** Constrain sources, retain citations and test retrieval misses.

**Acceptance evidence:** Retrieved evidence linked to output claims

## 3.10 Prompt contract design

### Mechanism

1. State objective
2. Provide context
3. Set constraints
4. Define format

| objective                                | context                                  | constraints                              | output_schema                          |
|------------------------------------------|------------------------------------------|------------------------------------------|----------------------------------------|
| Required state field for state objective | Required state field for provide context | Required state field for set constraints | Required state field for define format |

### Evidence and control

#### MEASURE

First-pass outputs meeting all contract fields

**Failure mode:** A long prompt hides conflicting instructions and undefined priorities.

**Control:** Separate goal, context, rules, examples and output contract.

**Acceptance evidence:** Prompt version and conformance checklist

## 3.11 Evaluation-set engineering

### Mechanism

1. Sample real tasks
2. Add edge cases
3. Freeze expected traits
4. Score runs

| task_id                                    | input                                   | expected                                        | score                               |
|--------------------------------------------|-----------------------------------------|-------------------------------------------------|-------------------------------------|
| Required state field for sample real tasks | Required state field for add edge cases | Required state field for freeze expected traits | Required state field for score runs |

### Evidence and control

#### MEASURE

Coverage across core, edge and adversarial cases

**Failure mode:** Teams judge prototypes from one impressive demonstration.

**Control:** Build a representative frozen set before optimisation.

**Acceptance evidence:** Versioned evaluation CSV and score report

## 3.12 Iteration and error taxonomy

### Mechanism

1. Classify failure
2. Find causal layer
3. Apply one change
4. Re-run set

| failure_type                              | layer                                      | change                                    | delta                               |
|-------------------------------------------|--------------------------------------------|-------------------------------------------|-------------------------------------|
| Required state field for classify failure | Required state field for find causal layer | Required state field for apply one change | Required state field for re-run set |

### Evidence and control

#### MEASURE

Improvement on failed cases without regression

**Failure mode:** Several prompt, model and data changes are bundled, obscuring causality.

**Control:** Change one causal layer per experiment and re-run the full frozen set.

**Acceptance evidence:** Experiment ledger with before-after deltas

### 3.13 Prototype-to-learning loop

#### Mechanism

1. Build thin slice
2. Expose to users
3. Capture signal
4. Revise hypothesis

| prototype                                 | test                                     | signal                                  | hypothesis                                 |
|-------------------------------------------|------------------------------------------|-----------------------------------------|--------------------------------------------|
| Required state field for build thin slice | Required state field for expose to users | Required state field for capture signal | Required state field for revise hypothesis |

#### Evidence and control

##### MEASURE

Validated assumptions per prototype cycle

**Failure mode:** Prototype polish becomes the goal instead of learning.

**Control:** Time-box builds and define the decision each prototype must unlock.

**Acceptance evidence:** Experiment brief and go-pivot-stop decision

## 4. Deploying and Evaluating Agentic AI-Powered Product Solutions

Design a deployment posture that preserves human control, security, observability, cost discipline and a production feedback loop.

### TOPIC OPERATING PRINCIPLE

Every agent handoff uses named fields; every consequential transition has a deterministic gate; every release decision resolves to evidence.

### 4.1 Prototype-to-production gate

#### Mechanism

1. Validate value
2. Validate behavior
3. Assess operations
4. Approve handoff

| value                                   | evals                                      | operability                                | decision                                 |
|-----------------------------------------|--------------------------------------------|--------------------------------------------|------------------------------------------|
| Required state field for validate value | Required state field for validate behavior | Required state field for assess operations | Required state field for approve handoff |

#### Evidence and control

##### MEASURE

Required gates passed before production investment

**Failure mode:** A working prototype is treated as production-ready software.

**Control:** Separate learning code from supported production architecture and evidence.

**Acceptance evidence:** Handoff pack with eval set, edge cases and prompt strategy

## 4.2 Deployment channel fit

### Mechanism

1. Map user context
2. Assess channel limits
3. Design fallback
4. Select channel

| context                                   | channel                                        | fallback                                 | choice                                  |
|-------------------------------------------|------------------------------------------------|------------------------------------------|-----------------------------------------|
| Required state field for map user context | Required state field for assess channel limits | Required state field for design fallback | Required state field for select channel |

### Evidence and control

#### MEASURE

Task completion and recovery rate by channel

**Failure mode:** The easiest integration is chosen despite poor user context or control.

**Control:** Compare web, workspace, messaging and embedded channels on task and risk.

**Acceptance evidence:** Channel matrix and fallback path

## 4.3 Reference deployment architecture

### Mechanism

1. Receive request
2. Orchestrate agent
3. Access tools
4. Record outcome

| request_id                               | orchestrator                               | tool_policy                           | audit_event                             |
|------------------------------------------|--------------------------------------------|---------------------------------------|-----------------------------------------|
| Required state field for receive request | Required state field for orchestrate agent | Required state field for access tools | Required state field for record outcome |

### Evidence and control

#### MEASURE

% transactions traceable end to end

**Failure mode:** Model calls, tool actions and user decisions cannot be correlated.

**Control:** Carry a stable request identifier through every component.

**Acceptance evidence:** Architecture diagram and correlated trace

## 4.4 API and integration contract

### Mechanism

1. Authenticate caller
2. Validate request
3. Execute bounded action
4. Return status

| identity                                     | schema                                    | action                                          | status                                 |
|----------------------------------------------|-------------------------------------------|-------------------------------------------------|----------------------------------------|
| Required state field for authenticate caller | Required state field for validate request | Required state field for execute bounded action | Required state field for return status |

### Evidence and control

#### MEASURE

% requests with schema-valid input and explicit outcome

**Failure mode:** Loose integrations permit malformed or over-broad actions.

**Control:** Use typed schemas, idempotency and explicit error states.

**Acceptance evidence:** API contract and negative-test results

## 4.5 Programming skill mix

### Mechanism

1. Specify behavior
2. Read interfaces
3. Test integration
4. Operate service

| prompting                                 | api                                      | testing                                   | operations                               |
|-------------------------------------------|------------------------------------------|-------------------------------------------|------------------------------------------|
| Required state field for specify behavior | Required state field for read interfaces | Required state field for test integration | Required state field for operate service |

### Evidence and control

#### MEASURE

Critical skill roles assigned with accountable owners

**Failure mode:** Natural-language prototyping is assumed to replace integration and operational expertise.

**Control:** Plan the product, prompt, data, integration, testing and operations skills explicitly.

**Acceptance evidence:** Skills matrix and gap plan

## 4.6 Security and privacy boundary

### Mechanism

1. Classify data
2. Minimise access
3. Protect tools
4. Audit use

| data_class                             | permission                               | tool_policy                            | audit                              |
|----------------------------------------|------------------------------------------|----------------------------------------|------------------------------------|
| Required state field for classify data | Required state field for minimise access | Required state field for protect tools | Required state field for audit use |

### Evidence and control

#### MEASURE

% sensitive paths protected by least privilege

**Failure mode:** Prompt injection or excess permissions turn untrusted content into consequential actions.

**Control:** Layer input controls, tool allowlists, approval and monitoring.

**Acceptance evidence:** Threat model, permission map and tested controls

## 4.7 Human oversight design

### Mechanism

1. Classify consequence
2. Set confidence gate
3. Route exception
4. Record decision

| risk_class                                    | threshold                                    | reviewer                                 | decision                                 |
|-----------------------------------------------|----------------------------------------------|------------------------------------------|------------------------------------------|
| Required state field for classify consequence | Required state field for set confidence gate | Required state field for route exception | Required state field for record decision |

### Evidence and control

#### MEASURE

% consequential actions with meaningful human review

**Failure mode:** A nominal approval step becomes routine click-through.

**Control:** Show the evidence and consequence at the point of decision.

**Acceptance evidence:** Approval log tied to current output

## 4.8 Observability and product KPIs

### Mechanism

1. Instrument event
2. Compute metric
3. Segment failure
4. Trigger action

| event                                     | metric                                  | segment                                  | action                                  |
|-------------------------------------------|-----------------------------------------|------------------------------------------|-----------------------------------------|
| Required state field for instrument event | Required state field for compute metric | Required state field for segment failure | Required state field for trigger action |

### Evidence and control

#### MEASURE

North-star outcome plus quality, cost and risk guardrails

**Failure mode:** Usage growth masks falling answer quality or rising correction work.

**Control:** Pair business outcomes with reliability, safety and experience measures.

**Acceptance evidence:** Metric tree and alert ownership

## 4.9 Quality, latency and cost frontier

### Mechanism

1. Measure quality
2. Measure latency
3. Load full cost
4. Choose frontier

| quality                                  | latency                                  | cost                                    | posture                                  |
|------------------------------------------|------------------------------------------|-----------------------------------------|------------------------------------------|
| Required state field for measure quality | Required state field for measure latency | Required state field for load full cost | Required state field for choose frontier |

### Evidence and control

#### MEASURE

Accepted outcome cost at target response time

**Failure mode:** The cheapest or fastest model is chosen without quality-adjusted comparison.

**Control:** Compare only configurations meeting minimum quality and risk thresholds.

**Acceptance evidence:** Pareto chart and selected operating point

## 4.10 Production evaluation loop

### Mechanism

1. Sample traffic
2. Score outcomes
3. Review failures
4. Release repair

| sample                                  | score                                   | failure                                  | release                                 |
|-----------------------------------------|-----------------------------------------|------------------------------------------|-----------------------------------------|
| Required state field for sample traffic | Required state field for score outcomes | Required state field for review failures | Required state field for release repair |

### Evidence and control

#### MEASURE

% production samples scored and actioned

**Failure mode:** Offline evals remain green while live inputs drift.

**Control:** Combine frozen regression sets with representative live sampling.

**Acceptance evidence:** Eval dashboard and linked repair record

## 4.11 Rollout and change management

### Mechanism

1. Pilot cohort
2. Train users
3. Expand gradually
4. Retire safely

| cohort                                | enablement                           | gate                                      | rollback                               |
|---------------------------------------|--------------------------------------|-------------------------------------------|----------------------------------------|
| Required state field for pilot cohort | Required state field for train users | Required state field for expand gradually | Required state field for retire safely |

### Evidence and control

#### MEASURE

Cohorts expanded only after approved thresholds

**Failure mode:** A big-bang launch creates unmanaged behavior and support load.

**Control:** Use staged rollout, telemetry, support playbooks and rollback criteria.

**Acceptance evidence:** Rollout plan with go/no-go gates

## 4.12 Feedback and graceful failure

### Mechanism

1. Detect uncertainty
2. Explain limit
3. Offer recovery
4. Learn from feedback

| uncertainty                                 | message                                | recovery                                | feedback                                     |
|---------------------------------------------|----------------------------------------|-----------------------------------------|----------------------------------------------|
| Required state field for detect uncertainty | Required state field for explain limit | Required state field for offer recovery | Required state field for learn from feedback |

### Evidence and control

#### MEASURE

Successful recovery rate after agent failure

**Failure mode:** The product hides uncertainty or traps users in repeated bad answers.

**Control:** Design honest limits, user control and a path to human help.

**Acceptance evidence:** Failure-state prototype and feedback taxonomy

## 4.13 Benefit-trade-off recommendation

### Mechanism

1. Quantify benefit
2. Price risk
3. Test scenarios
4. Recommend posture

| benefit                                   | risk                                | scenario                                | recommendation                             |
|-------------------------------------------|-------------------------------------|-----------------------------------------|--------------------------------------------|
| Required state field for quantify benefit | Required state field for price risk | Required state field for test scenarios | Required state field for recommend posture |

### Evidence and control

#### MEASURE

Net value remains positive under downside scenarios

**Failure mode:** The business case counts automation savings but excludes oversight, incidents and change cost.

**Control:** Use risk-adjusted scenarios and issue a pilot, expand, hold or stop decision.

**Acceptance evidence:** Executive decision memo with conditions and owner

## 5. Hands-on Activity Guide

Each activity is self-contained and includes a detailed README/PDF, YAML brief, prompt, mock CSV/JSON data, worked solution, verifier and evidence checklist.

### 5.1 Activity 01: Frame a Product Opportunity

#### OBJECTIVE

Turn synthetic stakeholder notes into a measurable agentic-AI opportunity brief.

#### Folder contents

- activities/activity-01-opportunity-brief/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

#### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run `python3 scripts/verify_activity.py` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

#### Lab-specific workflow checks

| Sequence | Workflow stage | What to inspect                                                                          |
|----------|----------------|------------------------------------------------------------------------------------------|
| 1        | Inspect notes  | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Name user      | Inputs, changed state, permissions, observable status and retained verification evidence |

|   |                   |                                                                                          |
|---|-------------------|------------------------------------------------------------------------------------------|
| 3 | Quantify friction | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4 | Define outcome    | Inputs, changed state, permissions, observable status and retained verification evidence |
| 5 | List assumptions  | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Set validation    | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Analyse the supplied stakeholder notes. Draft a product opportunity statement, baseline, target outcome and ranked assumptions. Distinguish evidence from inference.*

---

### Acceptance check

#### PASS ONLY WHEN

Every claim traces to a source row; the outcome is measurable; high-risk assumptions have named tests.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.2 Activity 02: Compare Agentic AI Builders

### OBJECTIVE

Run a common product-research task across three synthetic builder profiles and select a fit-for-purpose option.

### Folder contents

- activities/activity-02-builder-comparison/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run `python3 scripts/verify_activity.py` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage | What to inspect                                                                          |
|----------|----------------|------------------------------------------------------------------------------------------|
| 1        | Freeze task    | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Set criteria   | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Score builders | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Apply weights  | Inputs, changed state, permissions, observable status and retained                       |

|   |                  |                                                                                          |
|---|------------------|------------------------------------------------------------------------------------------|
|   |                  | verification evidence                                                                    |
| 5 | Test sensitivity | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Recommend        | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Use the supplied profiles and trial results to score three builders. Explain the recommendation and how it changes under an alternate weighting.*

### Acceptance check

#### PASS ONLY WHEN

Scores use one common task, weights total 100%, and the recommendation survives or explains sensitivity.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.3 Activity 03: Build a Research Evidence Pack

### OBJECTIVE

Transform mock market and competitor records into a traceable, uncertainty-aware insight brief.

### Folder contents

- activities/activity-03-research-evidence-pack/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run ``python3 scripts/verify_activity.py`` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage     | What to inspect                                                                          |
|----------|--------------------|------------------------------------------------------------------------------------------|
| 1        | Load records       | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Normalise facts    | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Triangulate claims | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Flag conflict      | Inputs, changed state, permissions, observable status and retained verification evidence |

|   |              |                                                                                          |
|---|--------------|------------------------------------------------------------------------------------------|
| 5 | Rank insight | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Cite sources | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Create a claim ledger from the supplied mock sources. Keep contradictions visible and assign a confidence level with rationale.*

---

### Acceptance check

#### PASS ONLY WHEN

Material insights cite at least two records or explicitly state single-source uncertainty.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.4 Activity 04: Create Persona and JTBD Map

### OBJECTIVE

Derive evidence-based personas and jobs-to-be-done without presenting generated assumptions as facts.

### Folder contents

- activities/activity-04-persona-jtbd-map/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run `python3 scripts/verify_activity.py` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage  | What to inspect                                                                          |
|----------|-----------------|------------------------------------------------------------------------------------------|
| 1        | Cluster needs   | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Draft persona   | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Write JTBD      | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Label inference | Inputs, changed state, permissions, observable status and retained                       |

|   |           |                                                                                          |
|---|-----------|------------------------------------------------------------------------------------------|
|   |           | verification evidence                                                                    |
| 5 | Rank risk | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Plan test | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Use the interview snippets to create two personas and JTBD statements. Mark every unsupported attribute as an assumption and propose a test.*

### Acceptance check

#### PASS ONLY WHEN

Persona needs trace to source IDs; assumptions are labelled; each risky assumption has a feasible validation test.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.5 Activity 05: Design an Agent Workflow Canvas

### OBJECTIVE

Map a product-discovery task into an agentic loop with tools, state, stop conditions and human gates.

### Folder contents

- activities/activity-05-agent-workflow-canvas/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run ``python3 scripts/verify_activity.py`` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage | What to inspect                                                                          |
|----------|----------------|------------------------------------------------------------------------------------------|
| 1        | Define goal    | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Map stages     | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Assign tools   | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Set schemas    | Inputs, changed state, permissions, observable status and retained verification evidence |

|   |           |                                                                                          |
|---|-----------|------------------------------------------------------------------------------------------|
| 5 | Add gates | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Set stop  | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Design the smallest workflow that can complete the supplied discovery task.  
Specify inputs, outputs, tools, failure paths and human decisions.*

---

### Acceptance check

#### PASS ONLY WHEN

Every stage has an owner and observable output; consequential actions stop for human review.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.6 Activity 06: Create an AI-Ready PRD

### OBJECTIVE

Convert an opportunity brief into outcome-focused requirements, user stories and acceptance examples.

### Folder contents

- activities/activity-06-prd-and-user-stories/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run ``python3 scripts/verify_activity.py`` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage  | What to inspect                                                                          |
|----------|-----------------|------------------------------------------------------------------------------------------|
| 1        | Restate problem | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Define behavior | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Write stories   | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Add examples    | Inputs, changed state, permissions, observable status and retained                       |

|   |               |                                                                                          |
|---|---------------|------------------------------------------------------------------------------------------|
|   |               | verification evidence                                                                    |
| 5 | Set non-goals | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Review gaps   | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Draft a lean PRD from the supplied opportunity brief. Focus on what must be true, include non-goals, and add positive, edge and failure examples.*

### Acceptance check

#### PASS ONLY WHEN

Requirements are testable, non-goals are explicit, and every priority story has three acceptance examples.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.7 Activity 07: Engineer a Prompt and Evaluation Set

### OBJECTIVE

Create a structured prompt contract and a frozen evaluation set for a product-feedback agent.

### Folder contents

- activities/activity-07-prompt-evaluation-set/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run ``python3 scripts/verify_activity.py`` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage  | What to inspect                                                                          |
|----------|-----------------|------------------------------------------------------------------------------------------|
| 1        | Define contract | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Sample cases    | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Add edges       | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Freeze rubric   | Inputs, changed state, permissions, observable status and retained verification evidence |

|   |              |                                                                                          |
|---|--------------|------------------------------------------------------------------------------------------|
| 5 | Run baseline | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Record gaps  | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Build a prompt contract and classify the supplied cases into core, edge and adversarial segments. Define observable scoring rules before optimisation.*

### Acceptance check

#### PASS ONLY WHEN

The evaluation set covers all segments; scoring rules are reproducible; baseline failures are retained.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.8 Activity 08: Run a Prototype Experiment

### OBJECTIVE

Evaluate a synthetic agent prototype, classify failures and recommend one causal improvement.

### Folder contents

- activities/activity-08-prototype-experiment/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run ``python3 scripts/verify_activity.py`` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage   | What to inspect                                                                          |
|----------|------------------|------------------------------------------------------------------------------------------|
| 1        | Run baseline     | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Score outputs    | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Classify failure | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Change one layer | Inputs, changed state, permissions, observable status and retained verification evidence |

|   |            |                                                                                          |
|---|------------|------------------------------------------------------------------------------------------|
| 5 | Re-run set | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Decide     | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Use the baseline outputs and rubric to identify the dominant failure. Propose one scoped change and calculate the expected impact without changing the test set.*

---

### Acceptance check

#### PASS ONLY WHEN

The change targets one causal layer, the frozen set is preserved, and regression risk is documented.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.9 Activity 09: Select a Deployment Posture

### OBJECTIVE

Compare channel and architecture options for an agentic product using task, integration and risk evidence.

### Folder contents

- activities/activity-09-deployment-decision/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run `python3 scripts/verify\_activity.py` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage      | What to inspect                                                                          |
|----------|---------------------|------------------------------------------------------------------------------------------|
| 1        | Map context         | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Compare channels    | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Select architecture | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Add fallback        | Inputs, changed state, permissions, observable status and retained                       |

|   |              |                                                                                          |
|---|--------------|------------------------------------------------------------------------------------------|
|   |              | verification evidence                                                                    |
| 5 | Cost posture | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Approve      | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Evaluate the supplied web, workspace and messaging options. Recommend a deployment posture and explain rejected alternatives.*

---

### Acceptance check

#### PASS ONLY WHEN

The selected option meets task, integration, safety and recovery thresholds; caveats are explicit.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.10 Activity 10: Conduct a Risk and Control Review

### OBJECTIVE

Threat-model an agent workflow and assign layered controls, evidence and owners.

### Folder contents

- activities/activity-10-risk-control-review/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run ``python3 scripts/verify_activity.py`` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage   | What to inspect                                                                          |
|----------|------------------|------------------------------------------------------------------------------------------|
| 1        | Map assets       | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Identify threats | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Score exposure   | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Select controls  | Inputs, changed state, permissions, observable status and retained verification evidence |

|   |              |                                                                                          |
|---|--------------|------------------------------------------------------------------------------------------|
| 5 | Assign owner | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Test control | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Use the supplied data-flow and incident cards to build a risk register. Apply least privilege and meaningful approval at consequential actions.*

### Acceptance check

#### PASS ONLY WHEN

High risks have preventive and detective controls, named owners and testable evidence.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.11 Activity 11: Design KPI and Feedback Dashboard

### OBJECTIVE

Create a metric tree and monitoring view that balances business value, quality, experience, cost and risk.

### Folder contents

- activities/activity-11-kpi-feedback-dashboard/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run `python3 scripts/verify_activity.py` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage | What to inspect                                                                          |
|----------|----------------|------------------------------------------------------------------------------------------|
| 1        | Set outcome    | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Add guardrails | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Define events  | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Set thresholds | Inputs, changed state, permissions, observable status and retained                       |

|   |               |                                                                                          |
|---|---------------|------------------------------------------------------------------------------------------|
|   |               | verification evidence                                                                    |
| 5 | Assign action | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | Review drift  | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Design KPIs from the supplied event dictionary and baseline. Include leading indicators, guardrails and an owner for each alert.*

---

### Acceptance check

#### PASS ONLY WHEN

Metrics have formulas, data sources, thresholds, segments and action owners; no vanity-only measure drives release.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 5.12 Activity 12: Deliver a Governed Product Recommendation

### OBJECTIVE

Synthesize value, evaluation, readiness and risk evidence into an executive pilot, expand, hold or stop decision.

### Folder contents

- activities/activity-12-executive-recommendation/README.md — detailed procedure
- README.pdf — detailed activity procedure and troubleshooting
- brief.yaml and prompt.md — machine-readable scenario and bounded task contract
- data/mock-data.csv and data/mock-context.json — synthetic inputs with source IDs
- scripts/verify\_activity.py, solution/expected-output.json and evidence/checklist.md

### Detailed procedure

1. Open the individual activity folder and read README.pdf, brief.yaml, prompt.md and evidence/checklist.md before starting.
2. Inspect the supplied mock CSV/JSON records and note their source IDs, observation date, limitations and missing fields.
3. Restate the product decision this activity must unlock and the observable acceptance rule.
4. Use prompt.md with an approved agentic AI builder; keep the role, data, tool and authority boundaries explicit.
5. Capture the plan, intermediate claims, handoff state and final artifact without introducing live or confidential data.
6. Trace every material claim to the supplied source rows and label inference, uncertainty and contradiction.
7. Review the artifact at the human gate; reject unsupported claims, unowned actions and uncontrolled automation.
8. Run `python3 scripts/verify\_activity.py` and retain its JSON result with the activity evidence.
9. Compare the result against the worked solution and diagnose one controlled failure without copying the solution.
10. Complete the evidence checklist and make a PASS, REPAIR or STOP decision against the acceptance rule.

### Lab-specific workflow checks

| Sequence | Workflow stage   | What to inspect                                                                          |
|----------|------------------|------------------------------------------------------------------------------------------|
| 1        | Summarise value  | Inputs, changed state, permissions, observable status and retained verification evidence |
| 2        | Compare evidence | Inputs, changed state, permissions, observable status and retained verification evidence |
| 3        | Price risk       | Inputs, changed state, permissions, observable status and retained verification evidence |
| 4        | Test downside    | Inputs, changed state, permissions, observable status and retained                       |

|   |                       |                                                                                          |
|---|-----------------------|------------------------------------------------------------------------------------------|
|   |                       | verification evidence                                                                    |
| 5 | <b>Set conditions</b> | Inputs, changed state, permissions, observable status and retained verification evidence |
| 6 | <b>Recommend</b>      | Inputs, changed state, permissions, observable status and retained verification evidence |

### Prompt contract

*Prepare an executive decision memo using only the supplied evidence pack.  
State the recommendation, conditions, residual risks and named owners.*

---

### Acceptance check

#### PASS ONLY WHEN

The recommendation is traceable to evidence, survives a downside scenario, and has measurable exit criteria.

### Troubleshooting

| Observed issue                                    | Likely cause                                               | Remedial action                                                                     |
|---------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| The agent invents a customer or market claim      | Source IDs were omitted from the prompt or output contract | Repair the prompt and require row-level citations plus an uncertainty label.        |
| The workflow recommends a tool without comparison | Criteria or common test case were not frozen               | Run every option on the same mock input and apply the stated weights.               |
| Output is plausible but unsupported               | Acceptance omitted observable evidence                     | Require the claim ledger, scored rubric and named decision owner before acceptance. |
| Verifier reports a missing artifact               | The required JSON/YAML field or output file is absent      | Use brief.yaml as the contract, add only the missing field and re-run the verifier. |

## 6. Agentic Product Control and Evidence Contract

An agentic product task is complete only when the requested state exists and the required checks demonstrate it. Preserve the product context, source evidence, agent and tool boundaries, handoff records, evaluation results and the named human decision at every consequential boundary.

### DEFAULT EXECUTION POSTURE

Start with the simplest workflow and narrowest workable authority, use approved synthetic data, keep consequential actions behind explicit approval, and reject completion claims unsupported by retrievable evidence.

## 7. Assessment Preparation

The Written Assessment contains six open-ended questions aligned to K1–K6. The Practical Performance contains three tasks covering A1–A3. Use the activity evidence model: observed value, approved threshold, decision and named owner.
